EXP 4(a)	Data Modelling and Form Design

Aim:

To design the data model of the Hotel Room Booking & Front Office Management application using Zoho Creator by creating the Rooms and Room Booking forms, applying validations and verifying the submitted data.

Theory:

Data modelling organises data into forms and fields. Zoho Creator supports field types such as Name, Email, Phone, Number, Decimal, Date, Drop Down, Lookup, Auto Number, File Upload and Checkbox.

The application uses two forms: Rooms (Room Number, Room Type, Rate Per Night, Capacity, Room Status) and Room Booking Form (guest, contact, stay, billing and requirement details). Room Number is mandatory and unique; Guest Name, Email, Phone, Room, Check-In Date, Check-Out Date, Number of Guests and Agree to Terms are mandatory.

Procedure:

1. Open Zoho Creator and open the Hotel Room Booking & Front Office Management application.
2. Create the Rooms form with Room Number (Number, mandatory, no duplicate values), Room Type (Drop Down), Rate Per Night, Capacity and Room Status (Available/Occupied/Maintenance).
3. Create the Room Booking Form with Booking ID, Status, Guest Name, Email, Phone, ID Proof, Room, Room Type, Check-In Date, Check-Out Date, Number of Guests, Rate Per Night, Nights, Total Amount, Special Requests and Agree to Terms.
4. Organise the fields into sections: Guest Details, Contact Details, Stay Details, Billing Details and Requirements.
5. Mark the required fields as mandatory.
6. Enter the sample rooms (101-401) and the six sample bookings (1001-1006).
7. Submit the form with a mandatory field empty and verify the validation message.

Output:

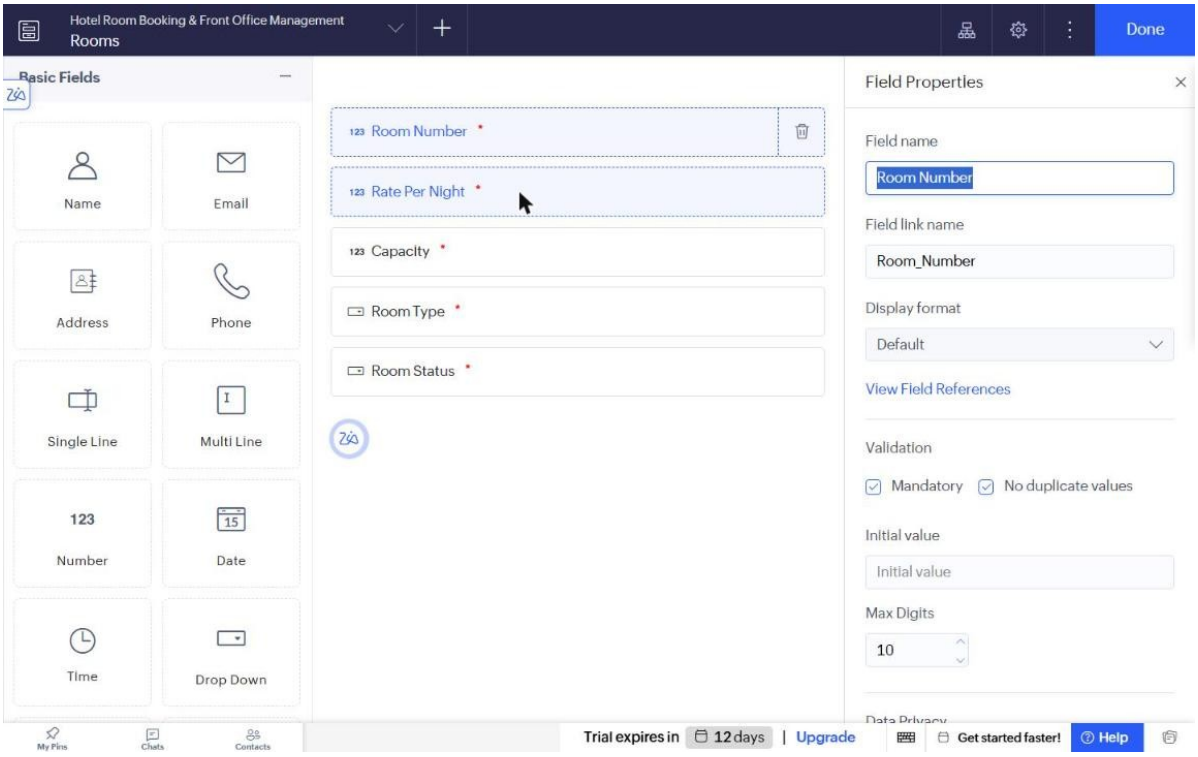

Fig. 4a.1: Rooms form design (Room Number mandatory, no duplicate values)

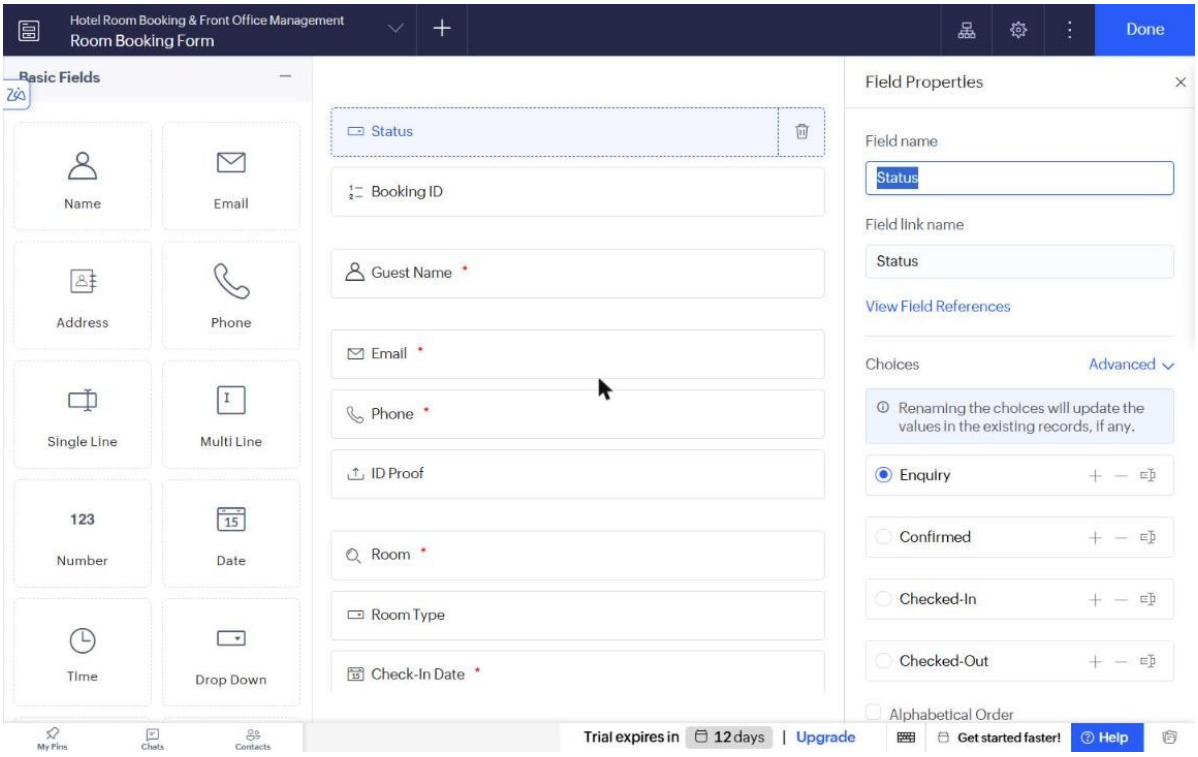

Fig. 4a.2: Room Booking Form design - guest, contact and stay fields

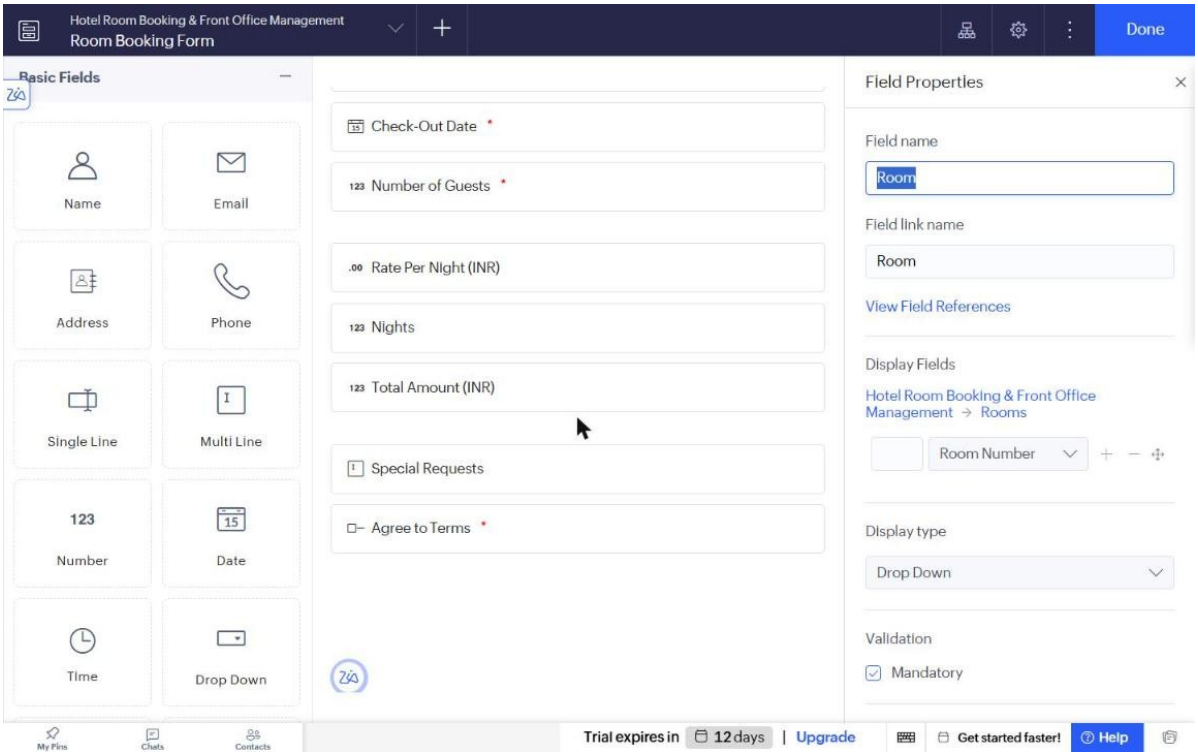

Fig. 4a.3: Room Booking Form design - billing and requirement fields

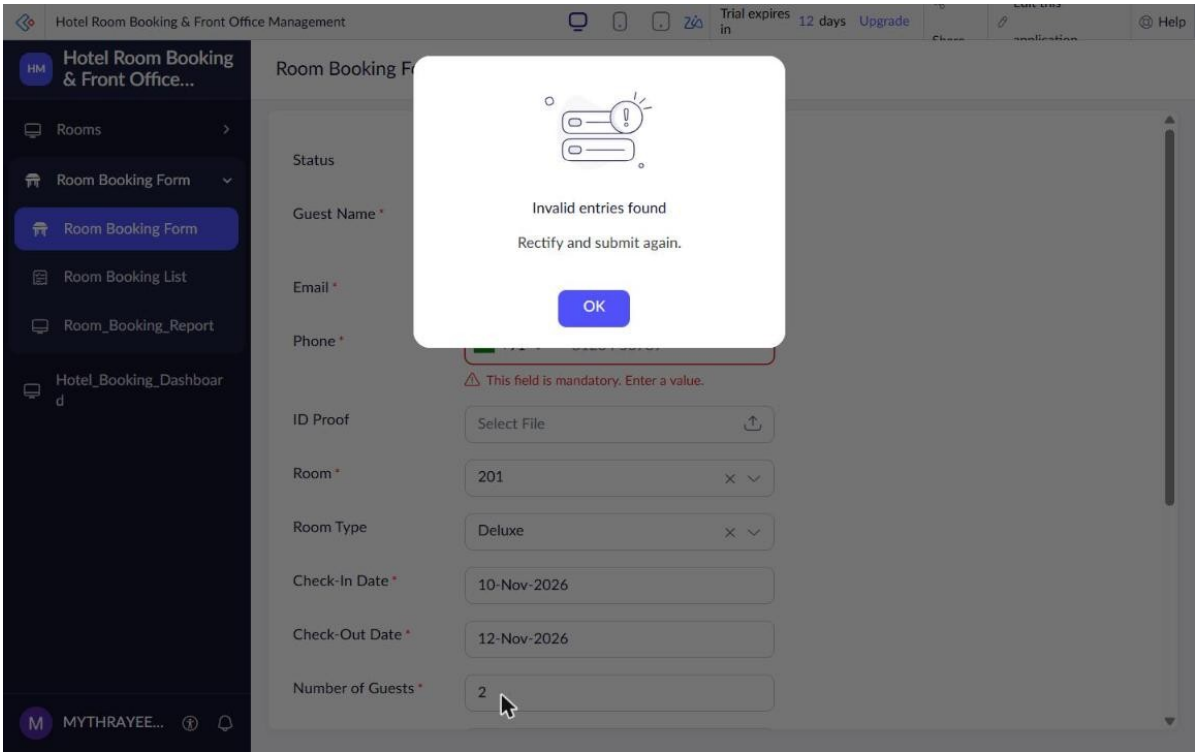

Fig. 4a.4: Submitting with Phone left empty

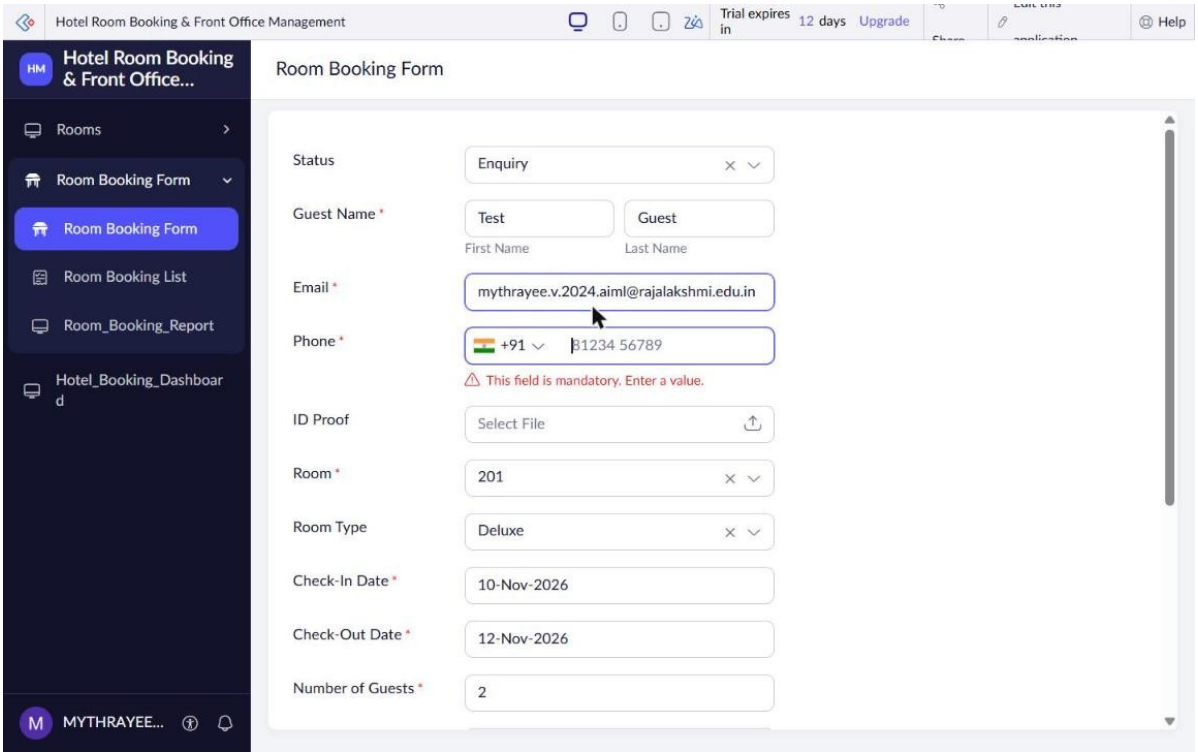

Fig. 4a.5: "This field is mandatory" validation for Phone

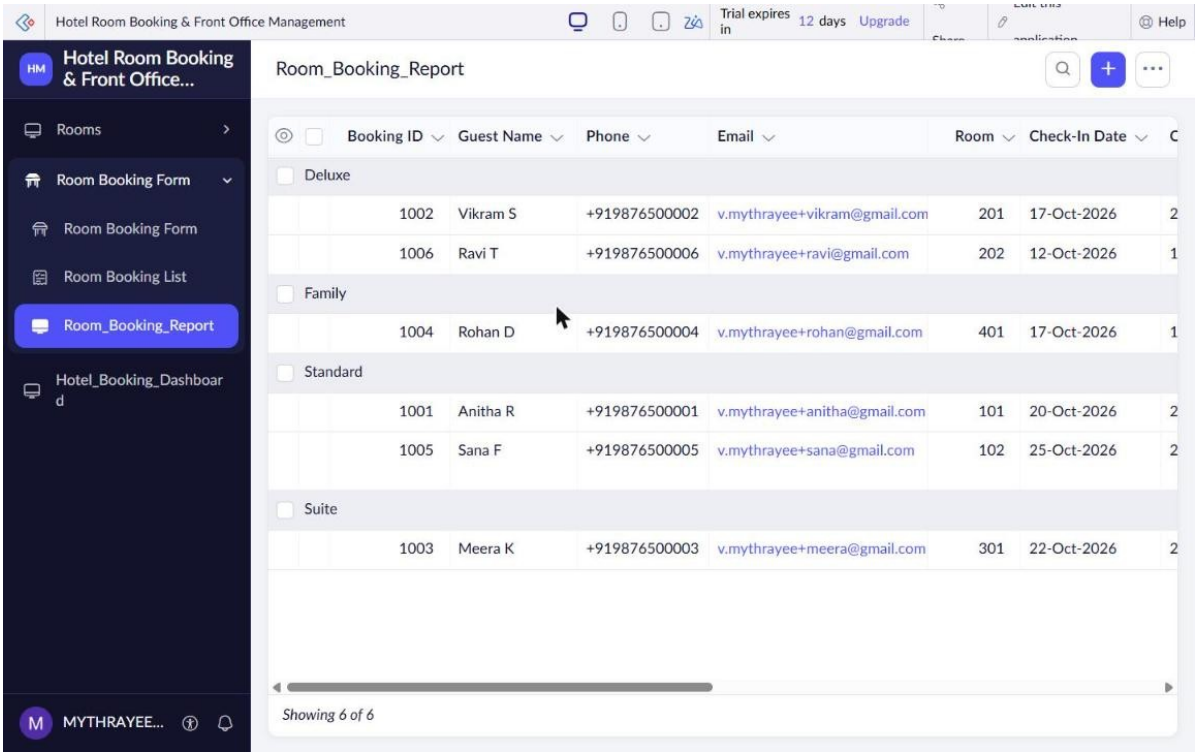

Fig. 4a.6: Submitted booking records

Result:

The Rooms and Room Booking forms were designed with suitable field types, sections and mandatory validations. Sample data was entered and the mandatory-field validation worked correctly.
