EXP 9	Implementing AI and Analytics Features Using Zoho Creator's Built-in Zia Capabilities

Aim:

To use the AI and analytics features of Zoho Creator in the Hotel Room Booking application to analyse booking data and support decisions.

Theory:

Zia is the AI assistant of Zoho. Creator provides AI Models (prediction, keyword extraction, object detection, sentiment analysis) under Microservices, and analytics through report grouping, filters, aggregates, charts, gauges and dashboards.

Procedure:

1. Open Microservices > Create New and view the AI Models option.
2. Open Room_Booking_Report and group the records by Status.
3. Filter the report to show only Confirmed bookings.
4. Open the Hotel_Booking_Dashboard with KPI panels and charts.
5. Study the charts and record observations.

Output:

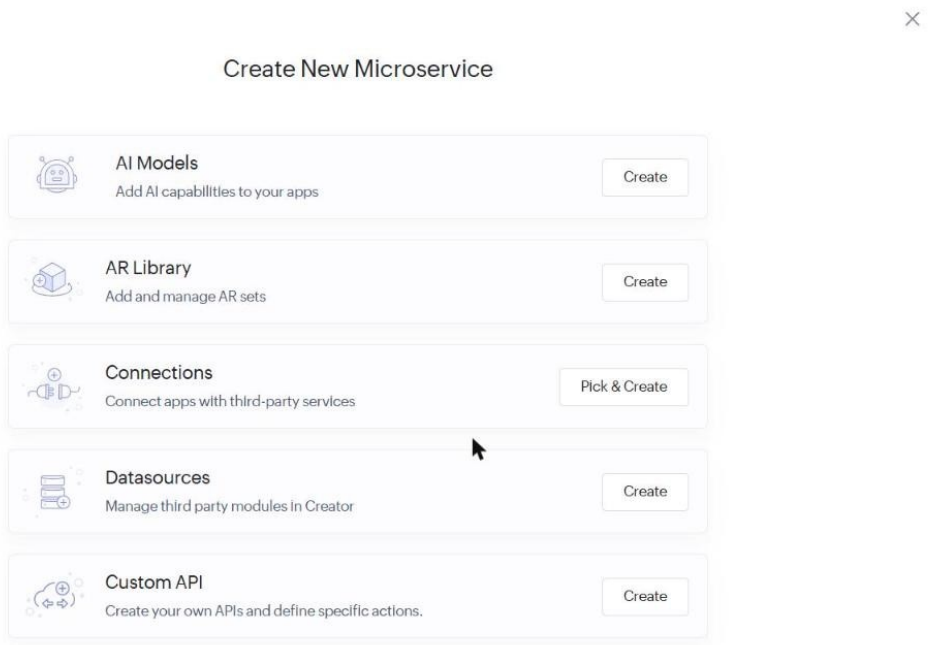

Fig. 9.1: AI Models (Zia) under Microservices

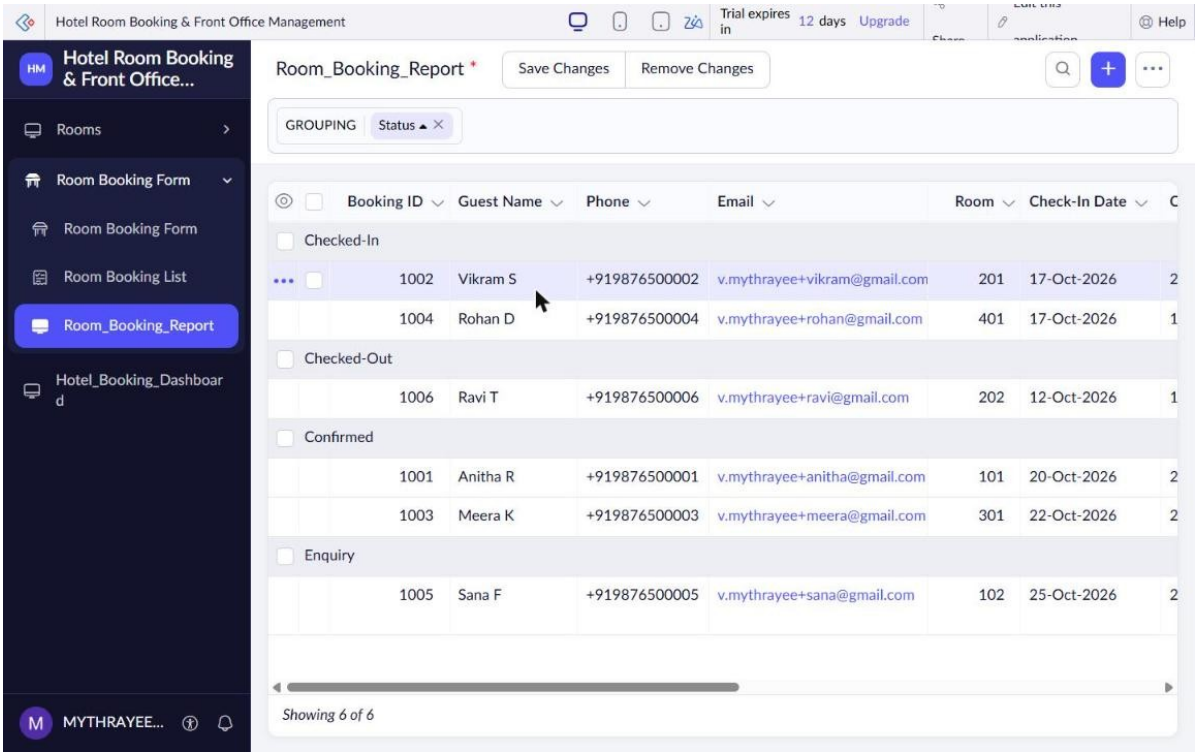

Fig. 9.2: Bookings grouped by Status

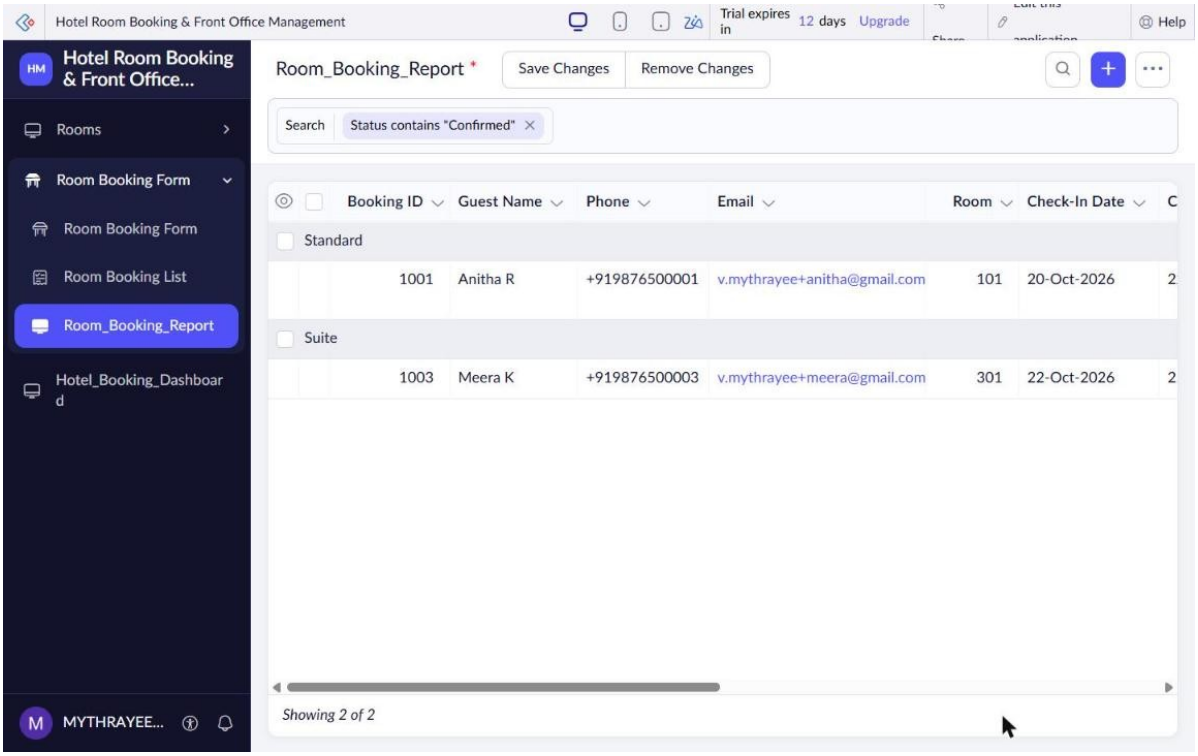

Fig. 9.3: Filtered analysis - Confirmed bookings

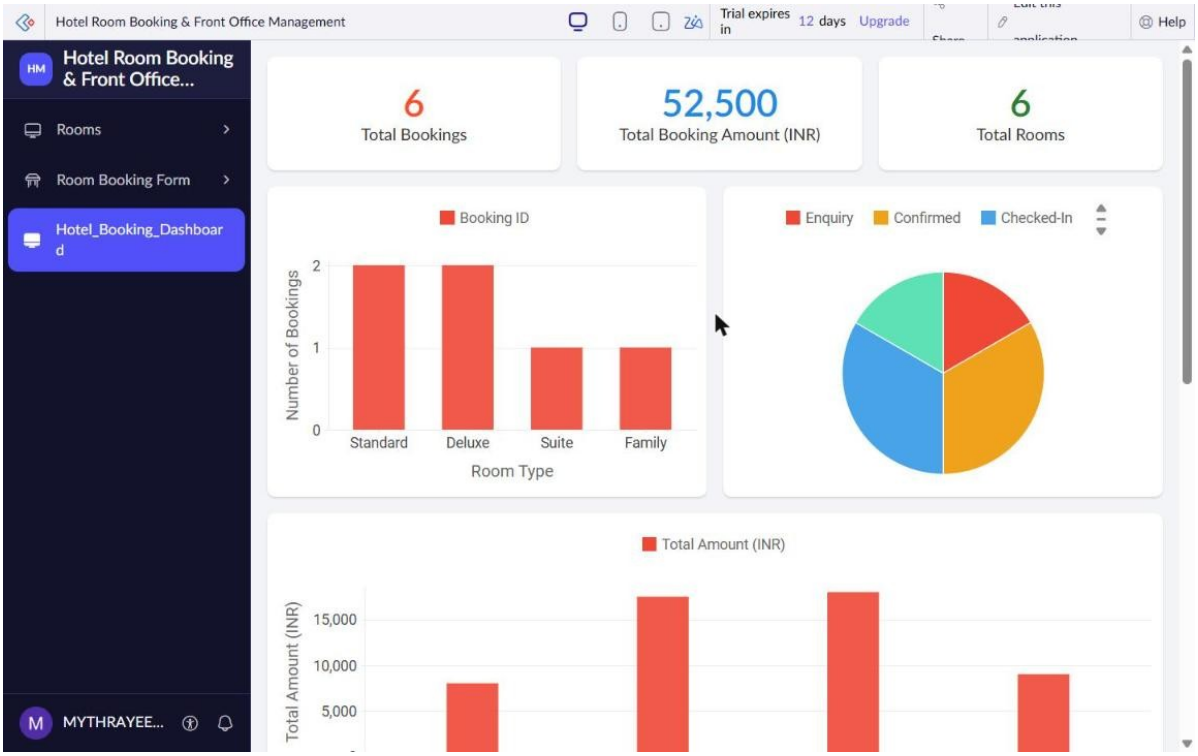

Fig. 9.4: Dashboard with KPI panels and charts

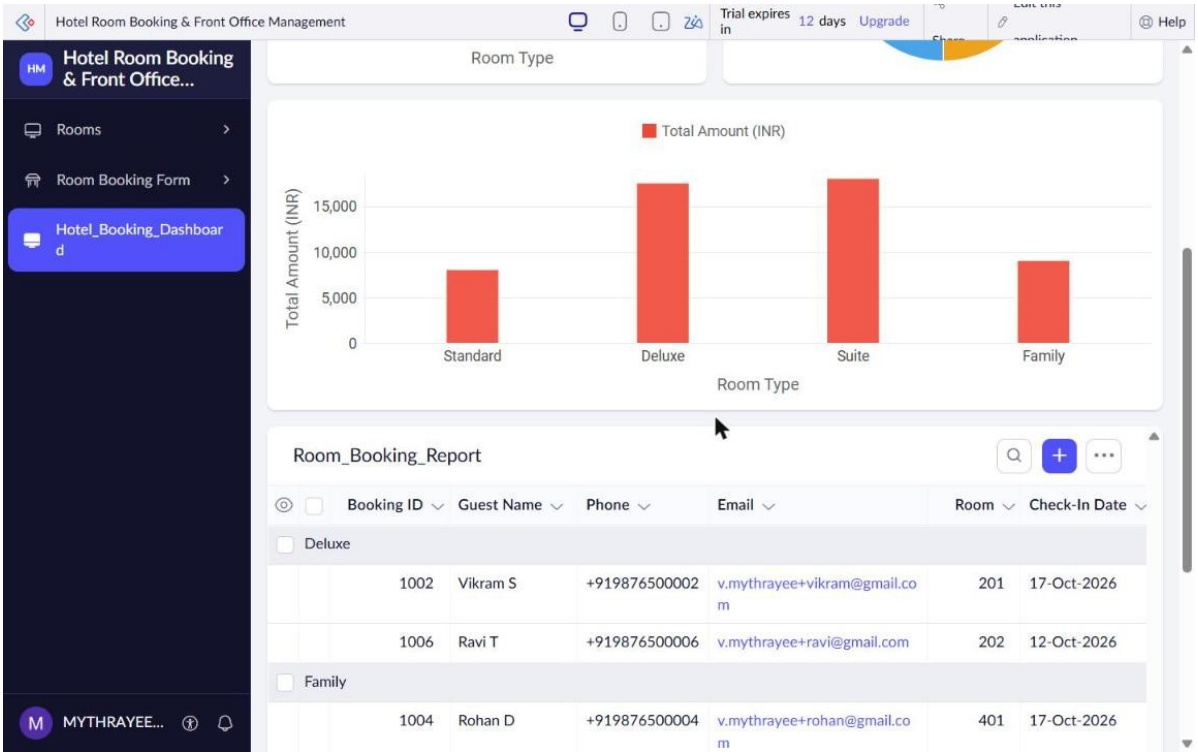

Fig. 9.5: Revenue by Room Type

Observation:

Room Type	Bookings	Total Amount (INR)

Standard	2	8,000
Deluxe	2	17,500
Suite	1	18,000
Family	1	9,000
Total	6	52,500

Result:

AI and analytics features of Zoho Creator were explored. The booking data was analysed using grouping, filters, KPI panels and charts; Suite and Deluxe rooms generate the highest booking amount.
