EXP 11	Deploying a Zoho Creator Application from Development to Production Environment

Aim:

To deploy the Hotel Room Booking application using the Environments feature of Zoho Creator (Development, Stage and Production).

Theory:

Zoho Creator provides three environments: Development (working copy for changes), Stage (testing by selected users) and Production (live app). Each publish creates a version; Version History keeps a record of every publish.

Procedure:

1. Open Zoho Creator and click Environments under Deploy.
2. Click Add Application and select Hotel Room Booking & Front Office Management.
3. Confirm with Add; Creator creates the development copy and the live app becomes Production 1.0.
4. Open the Publish menu to view the Stage and Production options.
5. Publish to Stage for testing.

Output:

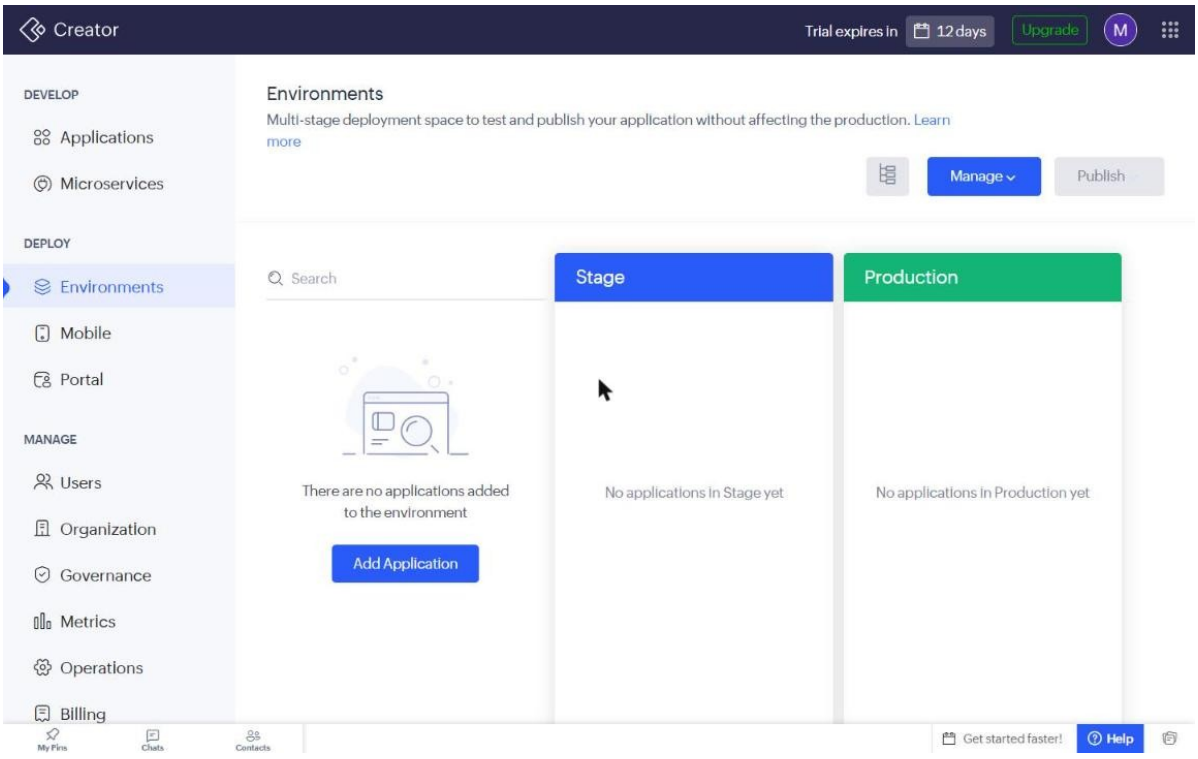

Fig. 11.1: Environments page before adding the application

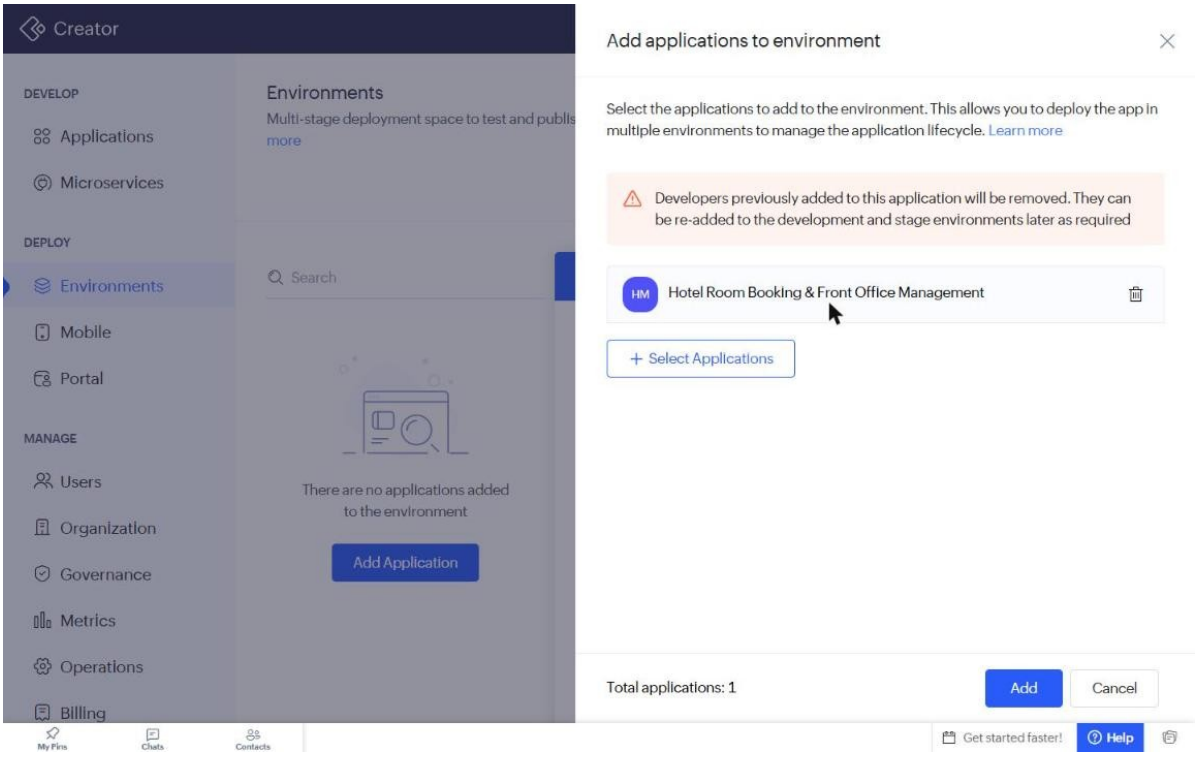

Fig. 11.2: Adding the Hotel application to Environments

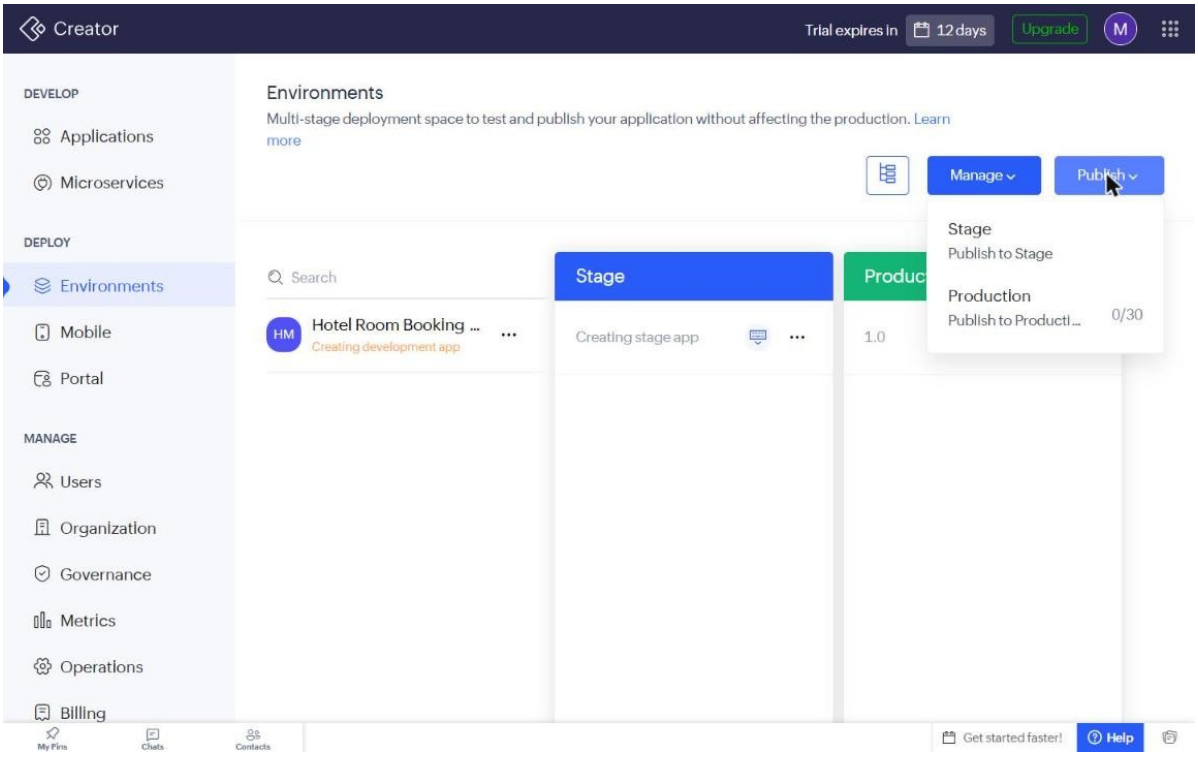

Fig. 11.3: Publish options - Stage and Production

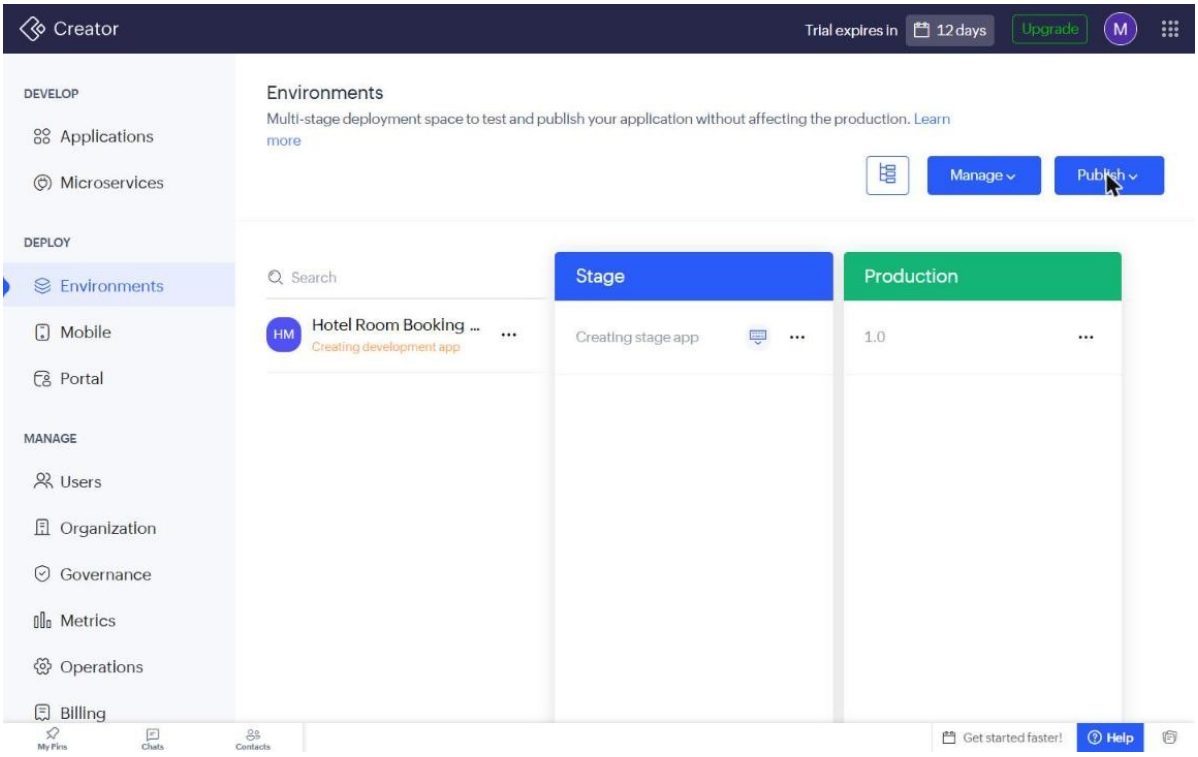

Fig. 11.4: Application in Environments - Stage and Production 1.0

Observation:

Environment	Purpose	Version
Development	Make and test changes	Working copy
Stage	Testing by selected users	Stage app
Production	Live app used by hotel staff	1.0

Result:

The Hotel Room Booking application was added to Environments, the live application became Production 1.0 and the app was published to Stage for testing.
